

Company: RevMed Informatics

Project: Use of Machine Learning to Intelligently Auto Populate Patient Documentation

Author: John Hon

Overview: RevMed Informatics is a software company based in Boston whose goal is to provide valuable tools for physicians and providers in their quest to provide patient-centric medical care. Its key product is a software algorithm that seamlessly integrates patient information in ways that circumvent the burdens associated with current EMR systems and result in more patient-centric care. This would be accomplished by creating a novel software algorithm to reduce the growing requirements of documentation in the electronic medical record/electronic health record (EMR/EHR).
